Thunk

Thunk

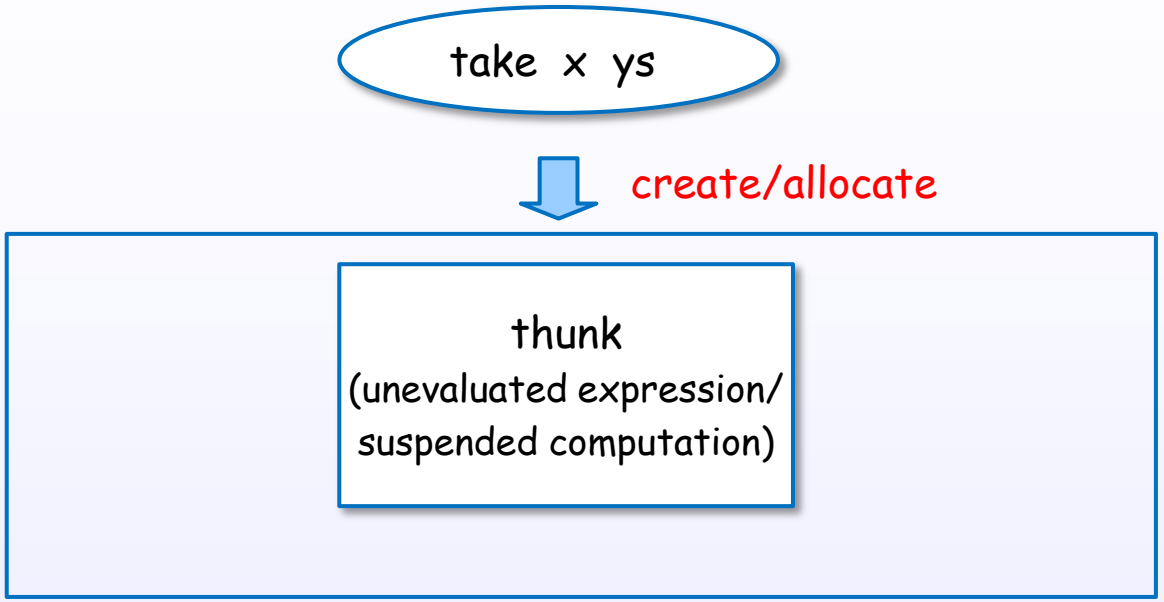
thunk
(unevaluated expression/
suspended computation)

A thunk is an unevaluated expression in heap memory.

References : [1]

Thunk

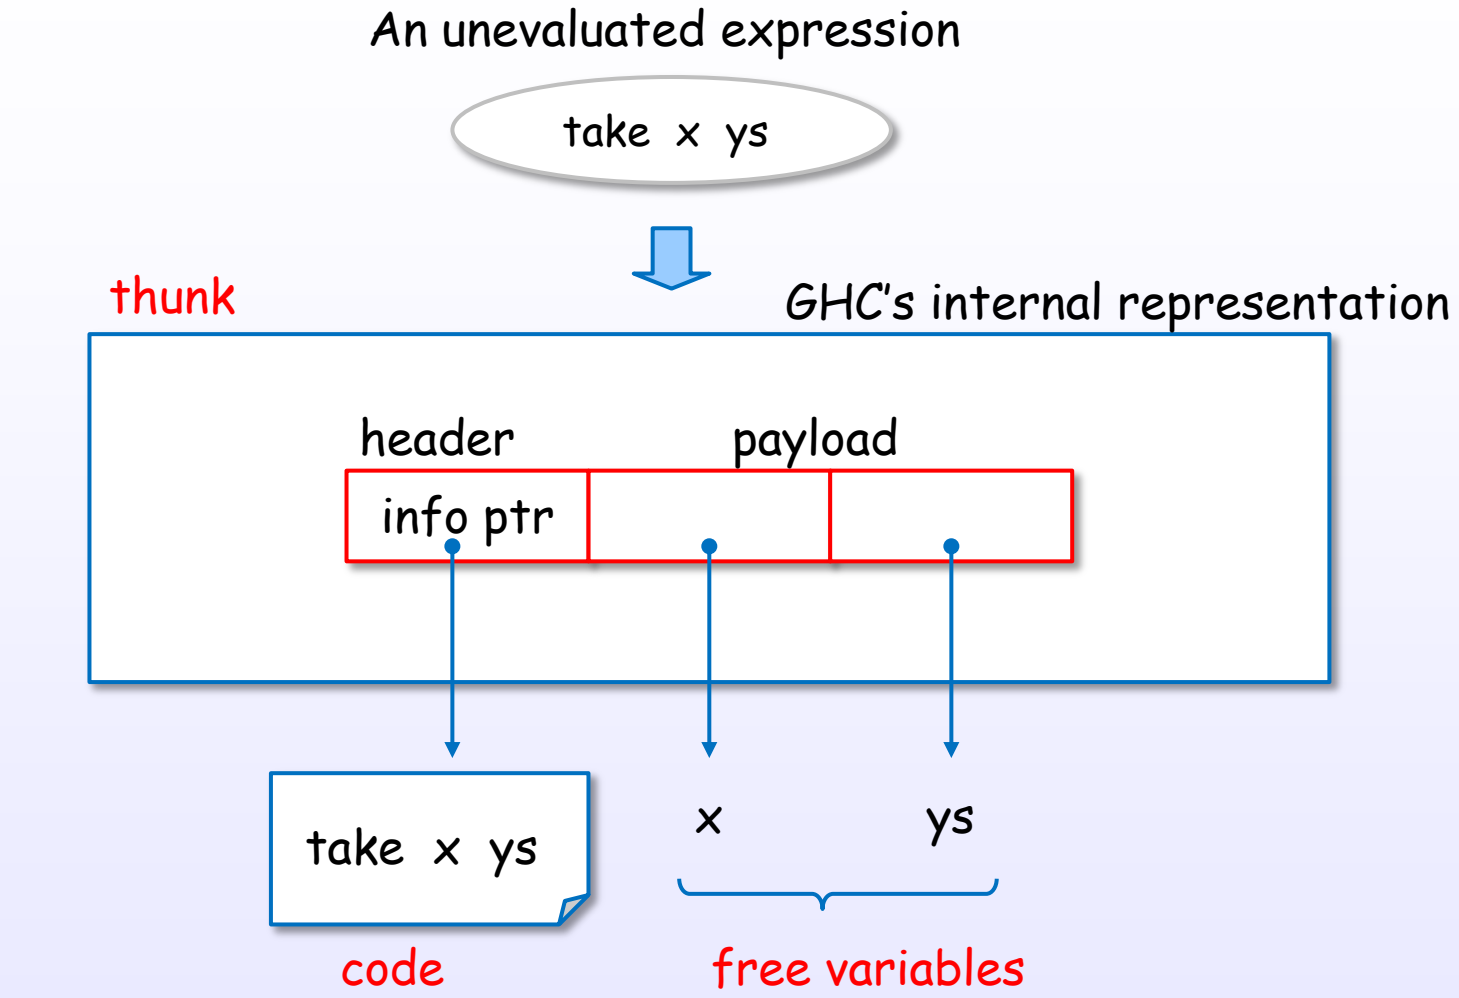
An unevaluated expression



A thunk is created for an unevaluated expression.

References : [1]

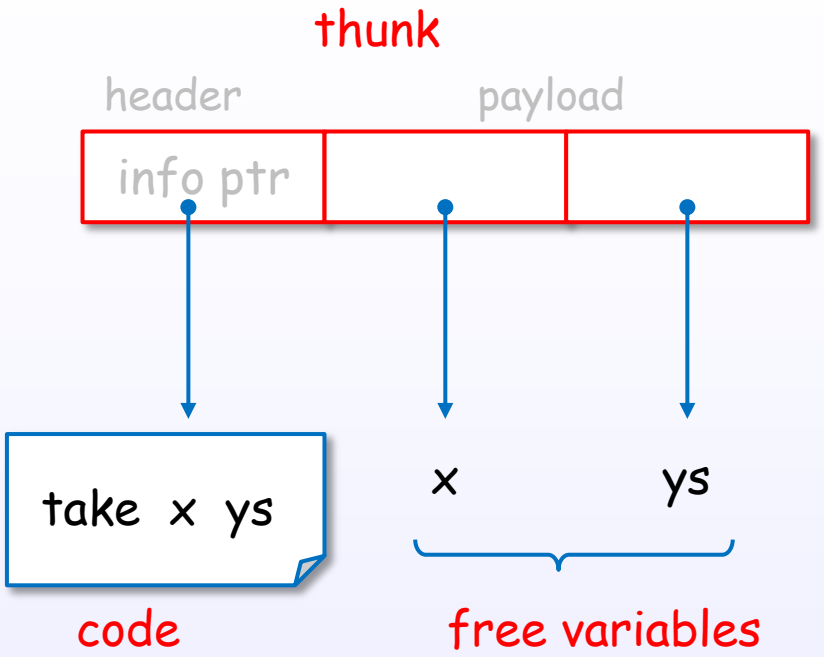
Thunkの内部表現



A thunk is represented with header(code) + payload(free variables).

References : [1]

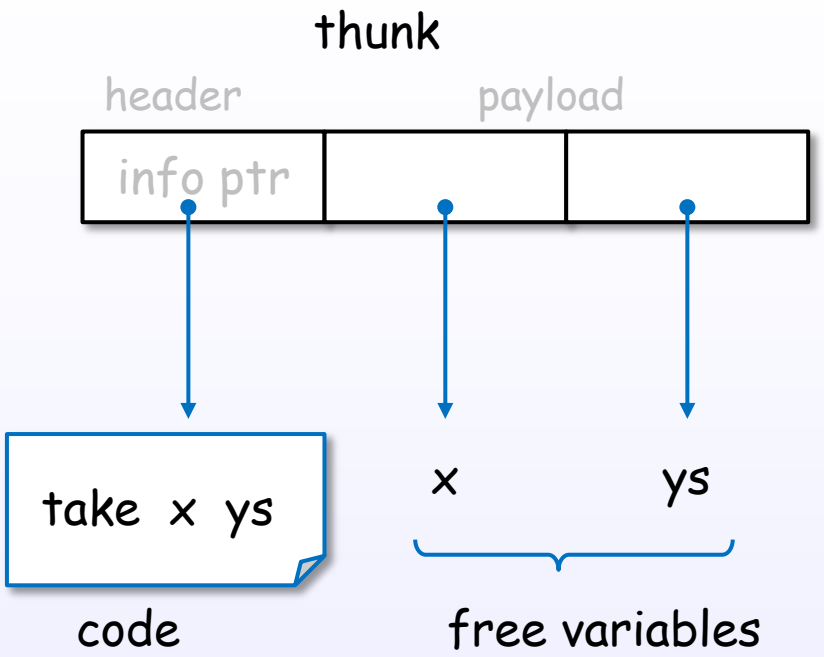
Thunkは、codeとfree variablesをパッケージ化したもの



A thunk is a package of code + free variables.

References : [1]

Thunkは、forcing要求により評価される



forcing

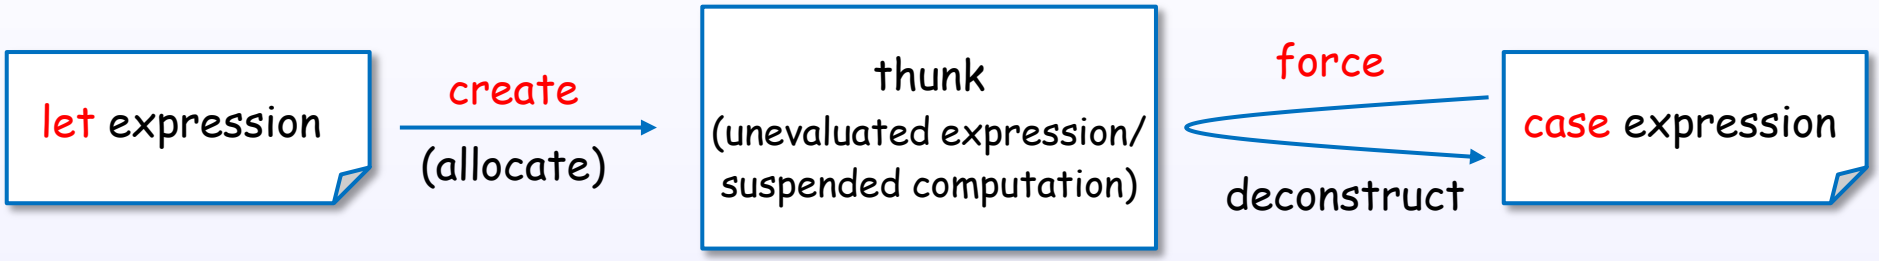
[1, 2, 3]

A evaluated expression

References : [1]

let, case expression

let/case expressions and thunk



A let expression may create a thunk.
A case expression forces and deconstructs the thunk.

WHNF

[4]

normal form:
an expression without an redexes

head normal form:
an expression where the top level (head) is neither a redex NOR
a lambda abstraction with a reducible body

weak head normal form:
an expression where the top level (head) isn't a redex

[Terei]

References : [1]

WHNF

[4]

evaluation strategies:
call-by-value: arguments evaluated before function entered (copied)
call-by-name: arguments passed unevaluated
call-by-need: arguments passed unevaluated but an expression is only evaluated once (sharing)

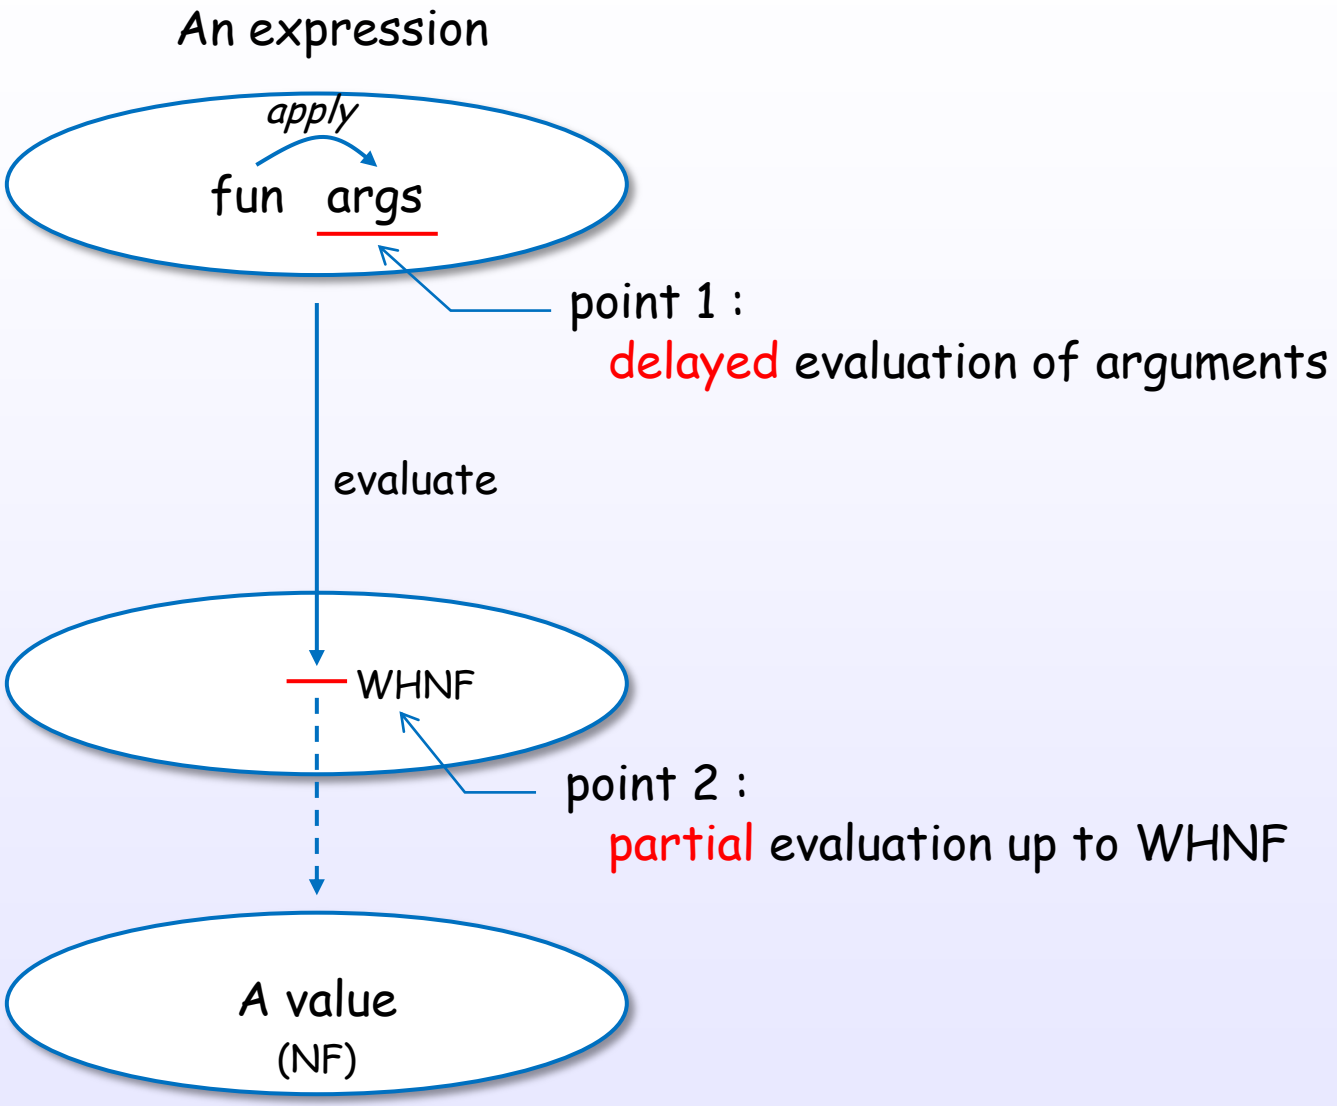
no-strict evaluation Vs. lazy evaluation:
non-strict: Includes both call-by-name and call-by-need, general term for evaluation strategies that don't evaluate arguments before entering a function
lazy evaluation: Specific type of non-strict evaluation. Uses call-by-need (for sharing).

[Terei]

References : [1]

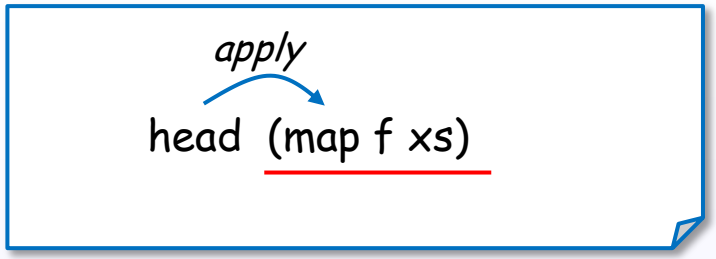
Evaluation in Haskell (GHC)

Key concept of Haskell's lazy evaluation

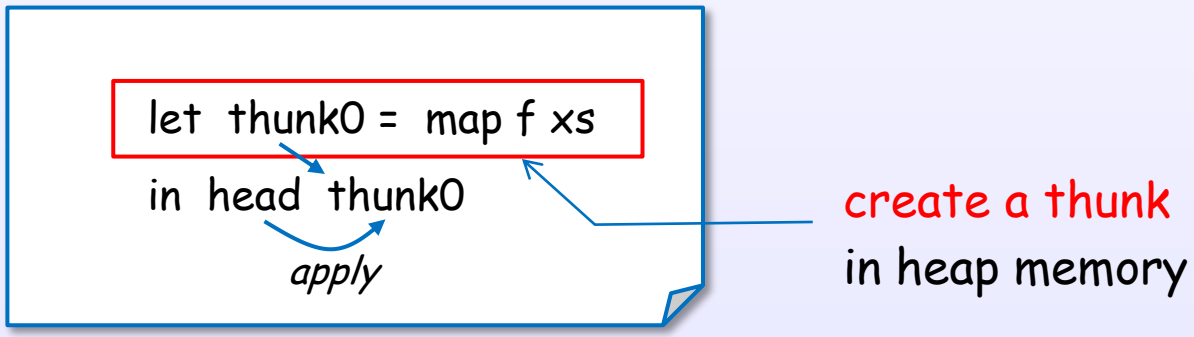


References : [1]

point 1 : delayed evaluation of arguments



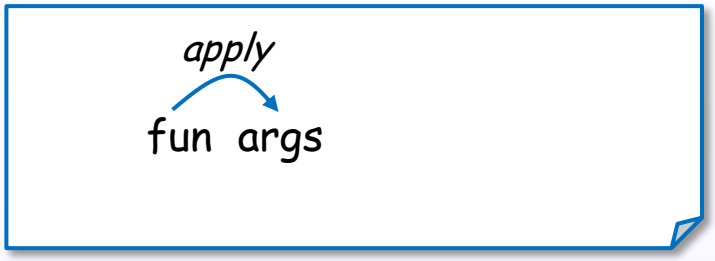
internal transformation by GHC



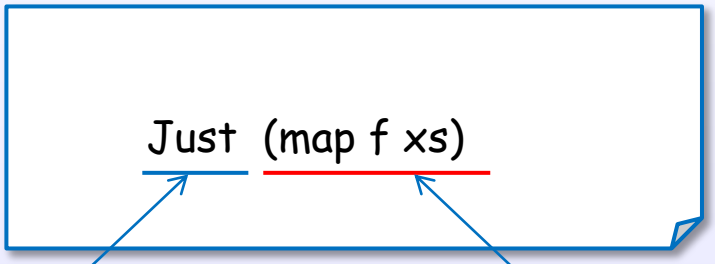
GHC implements lazy evaluation using the thunk.
Evaluation of arguments is delayed with the thunk.

References : [1]

point 2 : partial evaluation up to WHNF



evaluation up to WHNF



evaluated part
(head constructor)

unevaluated part
(thunk)

GHC can partially evaluate a expression.
Constructor can hold an unevaluated expression (a thunk).
